Description

"CRS unknown. Assumed EPSG:4326" string in the "Add layer" window is a wrong assumption when we add projected layers to a view defined in EPSG:4326. gvSIG should check the spatial extent of the layer we are adding, before assuming this. Only if the spatial extent is compatible with EPSG:4326 this assumption could be right. If not, the *"CRS is unknown"* and user has to set it manually (because projected files are not supported) in order to project it correctly in the view.

- Target version set to 2.3.0-2416 (rev. org.gvsig.desktop-2.0.122)
- Status changed from New to Outdated

I think that now, with the prj support (gvSIG 2.3), this ticket it's outdated
