Description

One of the most uncomfortable actions along a hyperlink configuration is filling in the file paths. It would be grate to have a tool that opens a file browser in which users could easily select the file they want to link and so its paths would be automatically filled in in the attribute table.

It could be a button in the table document tool bar, only enabled when in editing mode and there is one or more records selected and one field selected. The action could be "fill in a file path for the selected records in the selected field".

Other solution could be a tool that could be used wherever and whenever that would open a wizard that would ask users to select records and field on which the path has to be filled in.
