#### Description

Currently the combo boxes of the geoprocesses dialog boxes show a list containing all the layers loaded in the gvSIG project, this is, all the layers loaded in all the views. This causes that layers seem to be repeated.

As the user can't know which one of the repeated layers is the one loaded in the current view, sometimes he/she select a wrong one and the output layer is loaded in the other view, which is confusing and uncomfortable.

It would be more logical and useful that they only appear the layers loaded in the current view or, at least, make something that lets the user be able to differentiate them.
