| <p>In this method, the area of the surface referred to the data is used as the classification measure. The numerical values are classified in ascending or descending order. The limits are determined in a way that each class to include equivalent in area observations.</p> <p>Suggestion originaly made by Vassilis Krassanakis.</p> |           |                                |           |
