Description

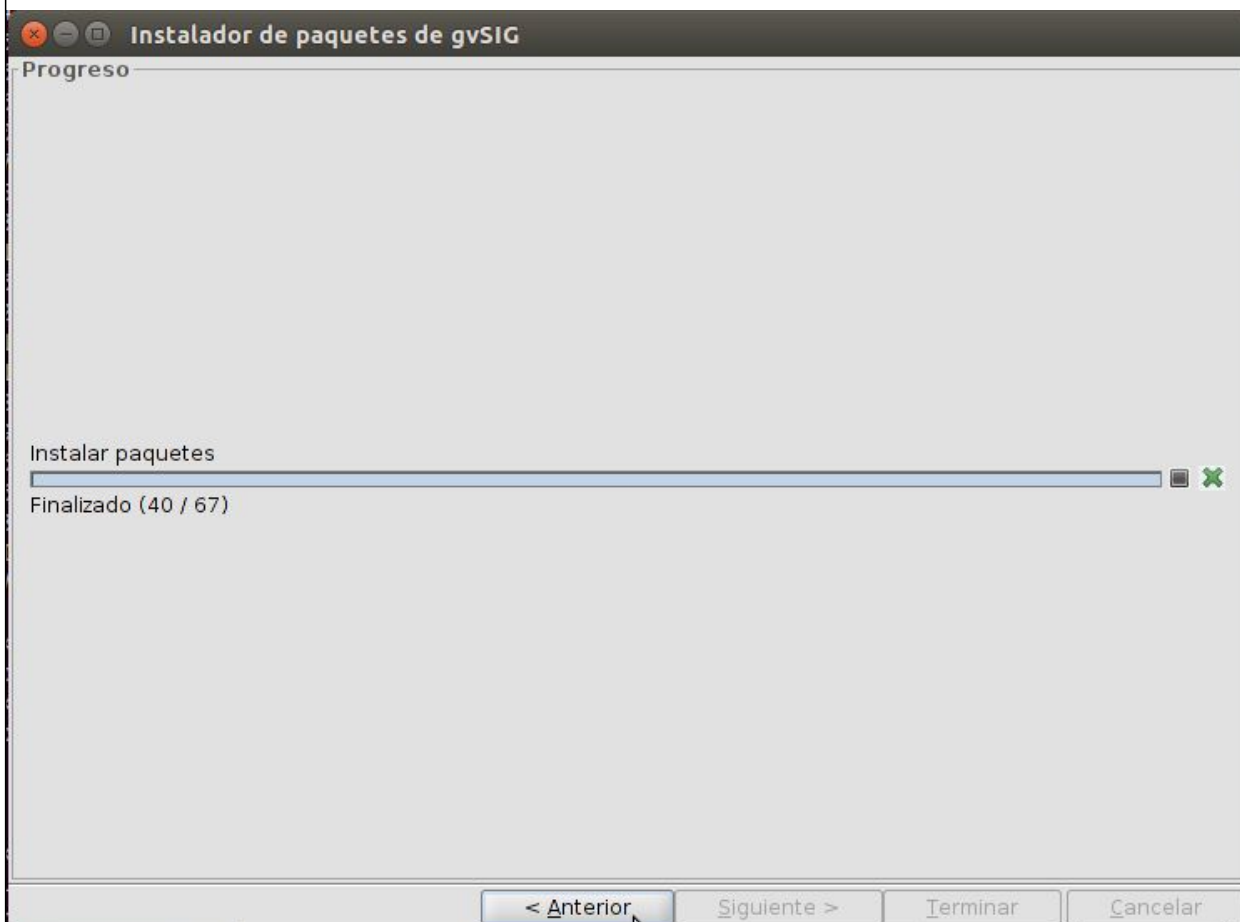

I have performed the following steps to try to install gvSIG:

Launch the gvSIG installer.

The installation begins as expected: I select Spanish as language, accept license and select **Standard installation**.

Next I select **Typical installation** and in the next step the package installation process starts installing each package.

At one point it says **Finalizado** but the number of installed packages is less than the total, and the **Siguiente** button is not active, so installation could not end nor be canceled, as you can see in the following image:

I can go to the previous step and try again, but it stops again at another random position or zero.

What has happened is that I had not enough space to install gvSIG, and the space become empty in the package installation process. It would be nice if the installer would tell the user which error had happened, like not having enough space.

As a plus, it would be nice if the installer could tell the user the required space beforehand.
