Description

When we add a raster datastore (e.g. an ASCII one or an old TIFF without prj), it's not possible to assign the CRS to the layer in its Properties in the Add layer dialog.

History

#1 - 03/16/2016 04:40 PM - Antonio Falciano

- Target version set to 2.3.0-2447-final (rev. org.gvsig.desktop-2.0.153)

Severity: Major

Because the prj file could not be parsed correctly for some reason or not available like in the examples above, this is a serious issue. If the user can't set the raster CRS, the raster layer is useless.

#2 - 06/16/2016 10:03 AM - Álvaro Anguix

- Target version deleted (2.3.0-2447-final (rev. org.gvsig.desktop-2.0.153))
