Description

I'm using gvSIG 1.9, extension extWFS2, and when a WFS layer has no features and you try to save a project a nullPointer is thrown because a call to getFullExtent() is performed but the full extent has a null value. So you are no more able to save a project unless you remove all empty WFS layer.

Is this bug still present in next version or maybe I should use extWFS as WFS extension?
